

Initial prompt:

Create a one-page website about traveling in the Philippines using HTML and CSS.

Include the following sections:

- Home (with a title like "Explore the Philippines" and a short tagline)
- About (why traveling in the Philippines is special)
- Top Destinations (at least 3 places like Boracay, Palawan, and Siargao)
- Travel Tips (basic tips for tourists)
- Contact or Call-to-Action

Use a tropical theme with colors like blue, green, and white.

Make the layout clean, simple, and visually appealing.

Refinements prompt 1:

Improve the website by adding a navigation bar with smooth scrolling between sections.

Add a hero section with a large background image and a "Start Exploring" button.

Enhance the design by improving spacing, font styles, and section layout.

Add images for each destination.

Refinement prompt 2:

Make the website fully responsive for mobile devices.

Add hover effects and animations for buttons and images.

Improve the design to look more modern and professional.

Add icons for travel tips and enhance the overall visual experience.

Initial prompt output:

1.

2.

3.

4.

5.

First refinement output:

1.

2.

3.

4.

5.

Second refinement output:

1.

2.

3.

4.

5.

Final reflection:

While creating my one-page website about traveling in the Philippines, I realized how helpful AI-assisted prompting can be in speeding up development. The initial prompt already gave me a working structure with sections like Home, About, Top Destinations, Travel Tips, and a Call-to-Action. It was a good starting point, but the design felt plain and not very engaging—especially for a travel website where visuals and layout really matter.

As I started using refinement prompts, I saw a big improvement in the overall look and feel of the website. Adding a navigation bar with smooth scrolling made it easier to move between sections, and the hero section with a background image made the page more eye-catching. Including images of places like Boracay, Palawan, and Siargao made the content more appealing and helped bring the theme to life. When I added responsiveness and some hover effects, the site started to feel more modern and closer to something you'd actually see online.

One thing I liked was how fast the AI could generate code based on my instructions. It saved me a lot of time, especially on the basic structure. However, I still had to make some manual adjustments, particularly with spacing, alignment, and styling, to get the design exactly how I wanted it.

Overall, this activity taught me that how you write your prompt really matters. A simple prompt gives you a basic result, but a more detailed one gives you something much better. I also learned that improving your prompts step by step is key to getting a good final output. AI can do a lot, but it still needs your input and creativity to make the project look polished and complete.
